

Giant Palm-lily

Cordyline manners-suttoniae

A palm lily native to coastal Queensland, where it is found in rainforests, often in swampy situations. Although this species grows naturally in swamp forest and rainforest from Cooktown to Rockhampton, it can tolerate dry spells.

It produces a slender trunk to nearly 5 m (17 ft.) tall, its leaves are dark green, stalked, to 65 cm (26 in.) long and 12 cm (5 in.) wide. In spring or summer it produces an attractive panicle of white flowers, followed by bright red berries. It is best suited to a tropical climate

Cordylines are very elegant and versatile plants and can be used in native bush gardens, open eucalypt forest, rainforest gardens, stylish architectural gardens, mixed in with exotics, as temporary indoor plants, or just about any part-shaded to well-lit area of the garden to provide interest using foliage form and very showy cascades of berries.
